Abstract

The problem based learning model is a learning model that invites students to solve a real problem in the environment. Collaboration skills are skills that emphasize care, cooperation, and responsibility for a problem that exists in the surrounding environment. This is in line with science learning which emphasizes problem solving and concern for problems in the surrounding environment. This writing aims to determine the relationship between the problem-based learning model and the increased collaboration skills in science learning. This study uses a literature study research method with data collection techniques from journals that have national, international reputation and are relevant to the research conducted. The results of this paper indicate that the problem based learning model can improve the collaboration skills of students. Through the problem- based learning model, students can exchange information and work together to solve a problem in their environment.
